

1. Ideation Phase

Project Module: Visitor Management System

Description

Built a ServiceNow-based Visitor Management System using Custom Applications, Flow Designer, Client Scripts, UI Actions, and Email Notifications to automate visitor registration, approval, and check-in processes.

This document serves as the formal milestone artifact for the ServiceNow development workflow lifecycle.

Problem Statement

Organizations often manage visitor registrations manually through phone calls, emails, or paper-based logs. This approach creates several challenges, including inaccurate visitor records, lack of real-time visibility, delays in approval processes, and security concerns. Reception and security teams find it difficult to track visitor status, resulting in inefficient visitor handling and poor visitor experience.

Furthermore, the absence of an automated system makes it difficult to maintain historical records, monitor visitor activity, and ensure that visitors are properly approved before entering the premises.

Proposed Solution

The proposed Visitor Management System leverages the ServiceNow platform to automate the complete visitor lifecycle. Employees can register visitors through a centralized application, where visitor details are captured and validated using Client Scripts.

Upon registration, Flow Designer automatically processes the request, updates the visitor status, and sends email notifications. Security or reception personnel can then use a custom UI Action to check visitors in, which automatically records the check-in time and updates the visitor status.

The system provides a centralized repository for visitor records, improves operational efficiency, enhances security, and enables real-time tracking of visitor activities.

Target Audience & Value Proposition:

Employees

A simple and user-friendly interface to register visitors before their arrival and receive automated notifications regarding visitor approvals.

Security & Reception Staff

An efficient system to manage visitor check-ins, track visitor status, and maintain accurate visitor records without manual paperwork.

Organization Management

Improved visibility into visitor activities, enhanced security compliance, automated workflows, and centralized visitor data management.

1. IDEATION PHASE – VISITOR MANAGEMENT SYSTEM

PROJECT MODULE:
Visitor Management System

DESCRIPTION:
Build a ServiceNow based system to automate visitor registration, approval, notifications, and check-in processes.

PROBLEM STATEMENT

Visitor management is currently handled manually using phone calls, emails, and paper logs. This leads to data inaccuracy, delayed approvals, lack of real-time visibility, and security concerns. Reception and security teams struggle to track visitor status, causing inefficiencies and poor visitor experience.

PROPOSED SOLUTION

A ServiceNow solution to automate the entire visitor lifecycle.

- Employees can register visitors through a centralized form.
- Flow Designer automates approval and sends email notifications.
- Security staff can check-in visitors with one click, capturing check-in time.
- All records are maintained in a centralized system with real-time status.

VISITOR MANAGEMENT FLOW

TARGET AUDIENCE & VALUE PROPOSITION

Employees

- Simple interface to register visitors.
- Real-time updates on visitor status.

Security / Reception

- Efficiently manage visitor check-ins.
- Maintain accurate visitor records.

Organization Management

- Improved visibility and security.
- Automated workflows and email notifications.
- Centralized visitor data management.

KEY BENEFITS

Saves Time

Improves Accuracy

Enhances Security

Real-time Tracking

Centralized Records
