

2. Requirement Analysis

Project Module: Visitor Management System: -

Description:

Detailed analysis of business requirements, user roles, field configurations, workflow automation, and system constraints for the Visitor Management System developed using ServiceNow.

This document serves as the formal milestone artifact for the ServiceNow development workflow lifecycle.

Functional Requirements: -

Visitor Registration Form:

A custom Visitor table containing the following fields:

- Visitor Name
- Employee Name (Reference to User table)
- Phone Number
- Email
- Company Name
- Visit Date
- Purpose of Visit
- Status
- Checked In Time

Data Validation:

A Client Script validates that the phone number contains exactly 10 digits before allowing record submission.

Auto Number Generation:

Each visitor request is assigned a unique auto-generated visitor number (e.g., VIS0001001).

A table is a collection of records in the database. Each record corresponds to a row in a table, and each field on a record corresponds to a column on that table. Applications use tables and records to manage data and processes. [More Info](#)

Insert a new row...

Automated Workflow:

Submission of a visitor record automatically triggers a Flow Designer workflow.

Status Management:

The system automatically updates visitor status from:

- Requested → Approved
- Approved → Checked In

Email Notifications:

The system sends automated email notifications when visitor registration is approved.

Check-In Management:

A custom UI Action allows security personnel to check visitors in with a single click.

Timestamp Tracking:

The system automatically records the visitor's check-in time during the check-in process.

Visitor Table Fields Map: -

Field Name	Field Type	Purpose
Number	Auto Number	Generates a unique visitor ID automatically.
Visitor Name	String	Stores the visitor's full name.
Employee Name	Reference (User)	Identifies the employee being visited.
Phone Number	String	Stores visitor contact number and validates 10 digits.
Email	String	Stores visitor email address for notifications.
Company Name	String	Stores the visitor's organization name.
Visit Date	Date	Records the planned visit date.
Purpose of Visit	Choice	Allows selection of Meeting, Interview, Delivery, Vendor Visit, or Other.
Status	Choice	Tracks visitor progress (Requested, Approved, Checked In, Completed).
Checked In Time	Date/Time	Records the exact visitor check-in time.

System Architecture & Scoped Application Constraints: -

Scoped Application Isolation:

The Visitor Management System is developed within a dedicated ServiceNow scoped application to prevent conflicts with global platform objects and ensure secure application management.

Flow Designer Native Automation:

Business processes are implemented using Flow Designer, reducing dependency on server-side scripting and improving maintainability.

Client-Side Validation:

Phone number validation is implemented using Client Scripts to ensure data quality before records are submitted.

UI Action Based Processing:

Visitor check-in functionality is implemented using a custom UI Action, enabling reception or security personnel to update visitor status efficiently.

Automated Notifications:

Email notifications are generated automatically through Flow Designer to improve communication and reduce manual follow-up activities.

Visual Implementation Evidence: -

Visitor Table Creation:

1. Navigate to **All → Tables** and create a custom table named **Visitor**.
2. Enable Auto Number generation for visitor records.
3. Configure table fields according to project requirements.
4. Set Visitor Name as the Display Field.

Client Script Configuration:

1. Navigate to **System Definition → Client Scripts**.
2. Create a new Client Script named **Validate Phone Number**.
3. Configure the script to validate a 10-digit phone number.
4. Save and test using valid and invalid inputs.

Flow Designer Configuration:

1. Navigate to **Flow Designer**.
2. Create a new flow named **Visitor Registration Flow**.
3. Configure the trigger as **Record Created** on the Visitor table.
4. Add an Update Record action to automatically change Status to Approved.
5. Add a Send Email action to notify visitors.

UI Action Configuration:

1. Navigate to **System Definition → UI Actions**.
2. Create a new UI Action named **Check In**.
3. Configure the script to:
 - Change Status to Checked In.
 - Populate Checked in Time.
 - Display a success message.
4. Save and test the functionality.

Testing:

1. Create a visitor record.
2. Verify phone number validation.
3. Confirm automatic approval through Flow Designer.
4. Verify email notification delivery.
5. Test the Check In button and validate timestamp generation.
